

S. B. JAIN INSTITUTE OF TECHNOLOGY, MANAGEMENT & RESEARCH, NAGPUR

Practical No – 8

AIM: Execution of two or more threads occurs in a random order. The keyword synchronized in Java is used to control the execution of threads in a strict sequence.

You are given a partially completed Java program that prints multiples of 5 using two threads. However, due to thread interleaving, the numbers may appear in a jumbled order or might be printed incorrectly.

Modify the program by appropriately using the synchronized keyword so that the output is printed in the correct sequential order as:

5 10 15 20 25 30 35 40 45 50
